

wire swap

Posted by flashracing - 2014/07/16 22:58

In the middle of doing a turbo swap into my rev 3 na with a rev 4 turbo engine. have the whole donor car here but just wondering can you avoid changing the car loom so that the boost guage in the dash works? or is there a pin already there for it? cheers

You must use the wiring going from passenger kick panel to the back of the car with the turbo engine, otherwise engine wont work, wiring can only be used with its engine, and if you want the boost gauge to work too you will have to swap out all the wiring behind the dash which is too much work for an inaccurate gauge, no need to swap out the wiring behind dash, just stick with the battery gauge its better.

Cheers for that spla. I know bought the engine loom but thought the car loom had the turbo wiring in place and just needed a pin swaped around to work.. ill leave her as is so..
